

•With a partner, we chose a shark to research. We wanted to know what it looked like, where it lived, what it ate, if it was considered dangerous, and other interesting facts.

•Based on the research, each group created a life size shark. First, we measured and cut paper the length our sharks, then drew them from head to tail, and finally cut them out. We added details with crayons, markers and chalk.

We put all of our sharks together and compared them to see which sharks were the longest, the shortest, and about the same size. We also compared our sharks to our own bodies. We discovered that sharks come in all different shapes and sizes.
